If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Office Action Summary

Application No.

10/663,861

Applicant(s)

NISHIZAWA, KAZUHIKO

Examiner

Alan Cariaso

Art Unit

2885

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 16 October 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
- 1) ☒ Certified copies of the priority documents have been received.
 - 2) ☐ Certified copies of the priority documents have been received in Application No. _____.
 - 3) ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on October 16, 2006 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1, 2, 9 and 10 are rejected under 35 U.S.C. 102(b) as being anticipated by OLDHAM (US 5,481,440).

4. In regards to claims 1 and 9, OLDHAM discloses an electronic device comprising an indicator (figs.1-5), including: a panel (13) on which said indicator (fig.5) is mounted and an insertion hole (22) provided through said panel (13), said indicator (fig.5) comprising a light guide (31) with one end surface (38) exposed to a front surface side (16) of said panel (13) and another end surface (39,42) projecting to a rear surface side (14) of said panel, through said insertion hole (22), and a light emitting unit (27)

provided on the rear surface side (14) of said panel (13) such that a light emitting portion thereof (27, fig.5) is opposed to the other end surface (39,42) of said light guide (31), and said light guide (31) is composed of a light transmitting elastic body (col.3, lines 60-66) having a uniform cross section (fig.4B) perpendicular to an axial direction thereof (figs.4A-4B), transforms (col.4, lines 42-50) when being pressed into said insertion hole (22), and is fixed by an outer peripheral surface (44,46,47) thereof near the one end surface being in pressure contact (col.4, lines 42-50) with an inner peripheral surface of said insertion hole (22), or frictionally held by said insertion hole.

5. Regarding claims 2 and 10, which commonly recite "wherein: said insertion hole is formed by performing burring for said panel from the front surface side thereof to the rear surface side; and holding of said light guide in said panel is implemented by said insertion hole having a contact area increased by the performance of the burring", note that the method of forming the device is not germane to the issue of patentability of the device itself. Even though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985). Therefore, these (i.e. method) limitations have not been given patentable weight.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 3-6 and 11-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over OLDHAM (US 5,481,440) in view of BRAIDWOOD (US 2,374,408).

8. In regards to claims 3 and 11, OLDHAM does not disclose "the length of said light guide is set shorter than a distance from the front surface of said panel to a top portion of said light emitting unit by a clearance". BRAIDWOOD teaches a radiolucent rod (54, figs.8-11) having a length shorter than a distance from the front surface of the panel (11) to a top portion of lamp (58) by a clearance (fig.8) for the purpose of directing light from the lamp (58) positioned behind the panel (11) to the output end (56) without light leakage (page 2, column 2, lines 48-50) and without thermal degradation of the rod. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the electronic-indicator device of OLDHAM to include the shorter length of the rod as taught by BRAIDWOOD in order to provide clearance between the lamp and the rod avoiding thermal degradation from the heat and maintaining optimal guiding of light without light leakage.

9. In regards to claim 12, given that BRAIDWOOD teaches the clearance between the light transmitting rod (54) and lamp (58), the clearance would appear to be capable defining a dimension which absorbs a cutting error occurring when the long light

Art Unit: 2885

transmitting elastic body is cut in the predetermined length to be formed into said chip form.

10. Claims 4-6 and 13-16 commonly recite "the end surface of said light guide on the front surface side of said panel is a rough surface" or "the end surface of said light guide on the front surface side of said panel is formed into a rough surface", not disclosed by OLDHAM. BRAIDWOOD teaches radiolucent rod element (19,20,21) having a front or end surface (19) that is ribbed (22) (page 1, col.2, lines 51-52) for the purpose of giving a lens or bull's eye effect. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the electronic-indicator device of OLDHAM to include the ribbed or rough end surface of the light guide as taught by BRAIDWOOD in order to optically refract emitted light and catch the bulls-eye or visual attention of an observer.

11. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over OLDHAM (US 5,481,440) in view of SALMON et al (US 5,938,324).

12. OLDHAM discloses the claimed invention including the insertion hole (22) connected to the panel (13) and which holds the light guide (31) with the inner wall (22) of the insertion hole (22). However, OLDHAM does not disclose a cylindrical flange connected to the panel.

13. SALMON teaches a display panel (63,64 fig.2B) formed of an opening (col.3, lines 29-33) (figs.2A-2B) having an inner wall of the cross-sectional area shape (24) corresponding to that of the light transmitting member (22) that includes a circular cross-

Art Unit: 2885

section (col.2, lines 54-56), and therefore a cylindrical flange of the panel (fig.2A) for the purpose of facilitating insertion of the light transmitting member into a secure position within the panel opening.

14. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the electronic-indicator device of OLDHAM to include the holes of the panel with cylindrical flanges as taught by SALMON et al in order to facilitate mechanical insertion of the light transmitting member into a secure position within the opening that enables optical alignment and efficient guidance of light through the light transmitting member or light guide and the opening.

15. Claims 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over OLDHAM (US 5,481,440) in view of GDOVIN et al (US 4,310,974).

16. OLDHAM discloses a method of mounting an indicator (figs.2 & 5) in an electronic device (fig.1), comprising: a first step of forming an insertion hole (col.2, lines 26-27) through a panel (13) of the electronic device (fig.1); a second step of placing a light emitting unit (fig.2) at a position apart from the insertion hole (21,22,23) on a rear surface side (14) of the panel (col.2, lines 44-47) by a predetermined length (by PCB 12) such that a light emitting portion thereof (figs.2-3 & 5) is opposed to the insertion hole (21,22,23); a third step of cutting (col.4, lines 16-28) a long light transmitting elastic body (31), which is formed to have a uniform shape of a cross section (col.4, lines 3-11) perpendicular to an axial direction thereof, in a predetermined length along a cross section perpendicular (38) or oblique (41,42) to the axial direction to form a light guide

Art Unit: 2885

chip (29,30,31); and a fourth step of pressing the light guide chip (31) into the insertion hole (22) of the panel (col.4, lines 42-43), thereby causing the light guide chip (31) to transform and be held in pressure contact with the inner peripheral surface of the insertion hole (col.4, lines 44-50), wherein said steps are performed in any step order of (1) to (5): (1) an order of said first, second, third, and fourth steps, (2) an order of said first, third, second, and fourth steps, (3) an order of said first, third, fourth, and second steps, (4) an order of said third, first, second, and fourth steps, and (5) an order of said third, first, fourth, and second steps; wherein the light guide chip (31) is pressed into (col.4, lines 47-52) said insertion hole (22) such that the end surface (38) is exposed to the front surface side (16) of said panel (13) in said fourth step.

17. However, OLDHAM does not disclose within the fourth step of pressing the light guide chip into the insertion hole from the front surface side of the panel, and at least one of the end surfaces of said light guide chip is formed into a rough surface in said third step. GDOVIN teaches a method step of inserting a precision cut optical fiber (45) in counter-bore (39) of plate (10) led by an input end of the fiber (45) against a bottom step of the bore (45) (col.5, lines 12-24) for the purpose of leaving a portion of the front or output end of the optical fiber to be a position of being shaped that provides any one or more directional light (col.5, lines 44-50). GDOVIN further teaches the output ends of the precision cut fibers to include the method of at least being ground (col.5, lines 44-47) for the purpose of providing output light that is omni-directional.

18. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the method of mounting an electronic-indicator device of

Art Unit: 2885

OLDHAM to include the step of inserting the optical fiber from the front surface of the plate and the front end surface of the optical fiber being ground or rough as taught by GDOVIN et al in order to individually position each optical fiber or light guide in a position that facilitates shaping the front output end especially if the order of forming or cutting parts of the light guide is changed and allows flexibility in variability of directional light, one of which output end includes a ground or rough surface end that increases its viewing angle with omni-directional output light.

Conclusion

19. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. OPPENHEIMER (US 4,917,448) shows an optical fiber light guide (60, fig.6) having a portion or end that is slightly flattened by a pressure force (col.7, lines 2-6) of the opening (64) of tip member (62) to retain the optical fiber (60) inside the tip member (62), which holds the optical fiber (60) within an insertion hole of display panel (36-40). MASUKO et al (JP 61133909 A) includes an English abstract that describes a fixing part (5) having its hole (5a) compressed and deformed so as to gnaw and fix the covering (1B) of the optical fiber (1,1A) as shown in figures 1-3. SHANKLE et al (US 6,195,016 B1) show a panel apparatus (fig.6) with insertion holes (101) that receive cylindrical body (104, figs.6-10) that have arms (106) pressed to fit and retain the body (104) within the hole (101). SHIH (US 6,234,657 B1) shows (fig.9) a plurality of optical fibers (22") with fiber ends (22a") penetrated (col.4, lines 3-4) through a display member (1"). YERGENSON (US 5,268,823) shows an output end

Art Unit: 2885

surface (83, figs.4 or 5A) of a light pipe (44) having either a corrugated or flat construction (col.5, lines 50-55) flush with openings in a display panel of an electronic instrument. HARDT (US 5,387,901) shows an LED indicating light assembly that includes plural light guides (figs.3,4,9,10) positioned on an aperture panel by supports (figs.5,6,8) spaced from internally positioned LEDs (figs.9-10). LEE (US 5,398,170) shows shaped light guide chips (106) held firmly against the inner wall of the panel apertures (111) (col.7, lines 13-19).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Alan Cariaso whose telephone number is (571) 272-2366. The examiner can normally be reached on 9-5:30 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Lee can be reached on (571) 272-7044. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
